

Sentifargo App Summary

What it is

Sentifargo is a production-grade multimodal AI platform for enterprise anomaly detection across fraud detection, cybersecurity monitoring, and behavioral analytics. It routes each request to the right subsystem (RAG, risk scoring, recommendations, vision, voice) and returns a single structured response.

Who it is for

Teams building enterprise fraud, cybersecurity, and behavioral risk analytics.

What it does

- FastAPI gateway exposing chat, RAG, fraud, cyber, vision, voice, and monitoring endpoints.
- Streamlit command-center UI with chat, multimodal uploads, and dashboards.
- Multimodal routing across fraud, cyber, behavior, vision, audio, NLP, and RAG model services.
- Fraud detection with transaction scoring, velocity analysis, and synthetic fraud generation.
- Cybersecurity analytics with network intrusion detection and attack timeline visualization.
- Monitoring and explainability with metrics, drift summaries, and SHAP.

How it works

- React/Streamlit UI sends REST/JSON requests to the FastAPI API.
- API calls an agent/orchestrator for intent routing and memory.
- Orchestrator dispatches to model services (fraud, cyber, behavior, vision, audio, NLP, RAG).
- Outputs are fused by a multimodal fusion + rule engine to produce risk scores and decisions.
- Monitoring + MLOps stack (Prometheus, MLflow, DVC) tracks metrics, drift, and registry; infra uses Docker, Nginx, Grafana, Redis.

How to run

- Prereq: Python 3.11+ (Node.js 18+ only for React UI).
- `python3 -m venv .venv && source .venv/bin/activate`
- `pip install -r requirements.txt`
- `uvicorn app.main:app --reload --port 8000`
- `Sentifargo_BACKEND=http://localhost:8000 streamlit run app/streamlit_chatbot/app.py`
